NEXT MEETING

Next Meeting is a ZOOM Format

May 11, 2021

This will be an in person ZOOM Meeting

7:00 p.m.

The Modern Presbyope: Considerations and Correction Options

Presented by:

Aaron McNulty, OD

Please register using the link provided in the cover letter, or the email you received. If you have any questions or problems registering, please contact Paula at slos@mailcam.com

Sponsored By Allergan and Synergeyes

We had 75 attend our April ZOOM meeting!
Thank you,
Dr. Marc Bloomenstein

Tales from the Lane, Cases that make you say "WUT"

Presented by: Marc R. Bloomenstein, OD, FAAO
Submitted by: Paul Luong, OD, FAAO

Case presentation clinical pearls:

- Amniotic membrane is the inner most lining of the placenta (amnion) and shares the same cell origins as the fetus. It contains cytokines and growth factors that can: promote healing, reduce inflammation, minimize scar, inhibit angiogenesis, minimize pain
- Eyelid neoplasms may arise from epidermis (most common), dermis or eyelid adnexal structures. The main goal is diagnose malignancy. Signs you're watching for include ulceration, bleeding, crusting, lash loss, etc. When in doubt, send for biopsy.
- 5 c's post cataract (what to watch for if patient has reduction in vision: Correction, Corneal surface, Capsule, Centration, CME
- Consider retained lens material in post-op cataract surgery patients if there is a combination of poor vision, increased IOP, and corneal edema
- Hyphema is when RBCs have settled inferiorly in the anterior chamber. It is most commonly the result of blunt trauma to the globe. Blunt force causes blood vessel of the iris or CB to break. In cases of a traumatic hyphema, you need to check the periorbital area and globe for injuries. Check vision. A/C depth, Seidel's sign, IOP, broken bones, EOMS, APD, Lens, Iris, Retina.

The first prescription therapy specifically for the short-term treatment of dry eye disease:

Presented by: Marc R. Bloomenstein, OD, FAAO
Submitted by: Paul Luong, OD, FAAO

Nearly 38 million US adults have symptoms consistent with dry eye disease. Aging is one of the most common risk factors include female gender and post-menopausal estrogen therapy. The burden of dry eye disease is predicted to escalate in the future, likely because of an aging population and an increasing dependence on multiscreen technologies. Inflammation plays a key role in the pathogenesis and symptomatology of dry eye.

Acute, dry eye flares have rapid onset and are inflammation-driven and this presents a potential opportunity for early corticosteroid treatment intervention.

EYSUVIS (loteprednol etabonate ophthalmic suspension) 0.25% is a corticosteroid indicated for the short-term (up to two weeks) treatment of the signs and symptoms of dry eye disease. Dosing is one to two drops into each eye four times daily for up to two weeks.
